

Nesting and Indentation

Read `book_chapter.txt` into Python, line by line,
Print the first 50 characters of each line, appending an
ellipsis ... at the end, if necessary.

```
with open('book_chapter.txt', 'r', encoding='utf-8') as file:
    for line in file:
        line = line.strip()
        if line:
            if len(line) > 50:
                print( line[0:50], '...' )
            else:
                print( line[0:50] ) # slicing gracefully,
                                    # but no ellipsis
```
